

Turing Way-Aligned Readiness Snapshot

Repository: stjude-biohackathon/KIDS25-Team1
Snapshot date: 2026-09-18
Reviewed commit: 3c091453bf185fd97e3596814f23321b8546ceaf
Status: Readiness snapshot only; not an official certification.

Method

The local turing-way-certified skill contract was followed after the active skill loader could not discover it. Scores use ten criteria, each 0-10, for a total out of 100. Required learning-assistant evidence tools were used before scoring; RAG status was ready for dataset turing-way with relevance score 89.0 and 9 sources. Repository inspection found only README.md and LICENSE before this report was generated.

Score table

#	Criterion	Score / 10	Repository evidence	Turing Way-aligned evidence
1	Project purpose and scope	6	README names the pipeline, authors, purpose, workflow stages, outputs, and references; intended users, limitations, risks, success criteria, roadmap, and maintenance scope are not explicit.	Turing Way project design guidance recommends defining scope, goals, expected users, resources, constraints, and outcomes.
2	Version control and provenance	4	GitHub history is visible with three commits; no releases, tags, changelog, provenance records for generated outputs, or versioned workflow artifacts are present.	Turing Way repository and reproducibility guidance emphasizes traceable history, version control, and provenance.
3	Open collaboration	0	No CONTRIBUTING.md, issue templates, pull request templates, code review guidance, maintainership information, discussion path, or CODE_OF_CONDUCT.md is present.	Turing Way documentation and participation guidance recommends contribution routes and respectful collaboration norms.
4	Reproducible environments	5	README documents conda setup, Python version, pinned package versions, IsoQuant setup, and Singularity images; no committed environment file, lockfile, container recipe, or setup script is present.	Turing Way reproducible environment guidance recommends documenting dependencies and using isolated environments or containers.
5	Data and workflow provenance	5	README identifies public PacBio data URLs, hg38 reference/annotation inputs, major workflow commands, and expected output names; checksums, schemas, provenance metadata, and committed scripts are absent.	Turing Way RDM guidance emphasizes findable and usable research materials; reproducibility guidance connects data, tools, code, and results.
6	Testing and validation	2	README describes comparing PacBio and TARGET outputs, but no tests, fixtures, expected-output files, validation scripts, or automated reproducibility checks are present.	Turing Way testing guidance recommends documented repeatable checks so users can know whether software behaves correctly.
7	Automation and continuous integration	0	No .github/workflows directory or other CI/automation configuration is present.	Turing Way CI guidance recommends automated checks to detect errors and support reproducible development.
8	Documentation and usability	7	README is detailed with setup, inputs, workflow commands, optional pipelines, DE analysis, images, notes, and references; usability is limited by missing scripts, directory structure, and onboarding docs.	Turing Way project documentation guidance says a README should introduce and explain a project with information needed to understand it.
9	Licensing, attribution, and responsible reuse	6	MIT LICENSE is present; README names authors and references. No CITATION.cff, citation statement, release metadata, or detailed attribution/reuse notes are present.	Turing Way licensing guidance emphasizes clear reuse terms; citation guidance recommends CITATION.cff metadata.
10	Ethics, accessibility, and sustainability	1	README mentions HPC use and public example data, but lacks ethical/privacy considerations, accessibility practices, sustainability expectations, ownership, archival plans, and maintenance guidance.	Turing Way project design and community guidance emphasizes responsible practices, transparency, accessibility, and long-term maintenance.

Total score: 36 / 100

Confidence: Medium-high. Repository-observable facts are high-confidence because the public repository contents at the reviewed commit were minimal and easy to enumerate. Overall confidence is medium-high because the local skill instructions were available and followed, and required learning-assistant evidence tools were used before scoring.

Checks performed

Confirmed the Markdown score table contains exactly ten rubric rows and the total 36 / 100. Confirmed this PDF exists, is non-empty, and contains normalized score table text including all ten criteria and the /100 total.

Limitations

This is not an official certification. It scores only observable public repository evidence at the reviewed commit and does not evaluate external repositories, private HPC paths, unpublished data, or command execution.
