

# Turing Way-Aligned Readiness Snapshot

This is a Turing Way-aligned readiness review, not an official certification. The Turing Way is public best-practice guidance from a community project, not a certification authority, accreditation body, or institutional policy. No score implies compliance sign-off or legal/regulatory approval.

## Ten-Criterion Rubric (0-10 each, total out of 100)

| #     | Criterion                                     | Score    | Observed evidence                                                                                                                                                                                                                      |
|-------|-----------------------------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | Project purpose and scope                     | 3        | README.md is a single-line title plus a 6-step script pipeline with no scope, intended-user, or limitations statement; a project-rationale paragraph exists only inside a GUI label string in gui.py, not as standalone documentation. |
| 2     | Version control and provenance                | 6        | 52 commits from 6+ contributors with descriptive merge commits referencing pull requests, but git tag returns no tags/releases marking citable snapshots.                                                                              |
| 3     | Open collaboration                            | 2        | No CONTRIBUTING.md, CODE_OF_CONDUCT.md, issue templates, or .github/ directory exist, despite multiple contributors and PR-based merges visible in history.                                                                            |
| 4     | Reproducible environments                     | 3        | requirements.txt pins 18 dependencies but is UTF-16LE encoded with CRLF endings, breaking a standard pip install; no setup instructions, Dockerfile, or environment capture exist.                                                     |
| 5     | Data and workflow provenance                  | 2        | data/yaml.yaml defines only bare YOLO dataset fields; scripts use hardcoded relative paths with no data dictionary, source description, or provenance notes.                                                                           |
| 6     | Testing and validation                        | 1        | No automated test suite exists; src/test.py is a manual YOLO inference script with no assertions, fixtures, or pytest/unittest usage.                                                                                                  |
| 7     | Automation and continuous integration         | 0        | No .github/workflows directory or any CI configuration exists; the only YAML file is a dataset config, not automation.                                                                                                                 |
| 8     | Documentation and usability                   | 2        | README.md (708 bytes) lists only manual data-prep steps; it never mentions gui.py (a 21KB PyQt5 application), the scripts/ tools, or how to install/run any part of the project.                                                       |
| 9     | Licensing, attribution, and responsible reuse | 5        | A complete MIT LICENSE file is present with a clear copyright holder, but there is no CITATION.cff and no attribution for third-party dependencies or bundled media assets.                                                            |
| 10    | Ethics, accessibility, and sustainability     | 1        | Despite processing proton beam radiotherapy treatment video/imagery, there is no ethics, privacy, or accessibility documentation; the presentation file is an empty 0-byte placeholder and no maintenance/archival plan is documented. |
| Total |                                               | 25 / 100 |                                                                                                                                                                                                                                        |

## Evidence-Backed Recommendations

- 1 Add a project scope/purpose section to README.md (Project Design chapter). Evidence: README.md is a one-line title with a script pipeline only.
- 2 Tag stable releases with annotated Git tags/GitHub releases (Version Control chapter). Evidence: 52 commits with PR merges but no git tags exist.
- 3 Publish CONTRIBUTING.md, CODE\_OF\_CONDUCT.md, and issue/PR templates (Collaboration chapter). Evidence: no such files exist anywhere in the tree.
- 4 Re-save requirements.txt as UTF-8 and document setup (Reproducible Environments chapter). Evidence: requirements.txt is UTF-16LE encoded with CRLF terminators.

- 5 Document data/workflow provenance next to data/yaml.yaml (Version Control chapter). Evidence: data/yaml.yaml has no accompanying documentation.
- 6 Add an automated test suite to replace the manual src/test.py script (Code Testing chapter). Evidence: src/test.py only runs a manual model prediction and prints results.
- 7 Set up CI (e.g. GitHub Actions) to run checks on each change (Continuous Integration chapter). Evidence: no .github directory exists in the repository.
- 8 Expand README.md to document installation, the GUI app, and script usage (Communication chapter). Evidence: README.md never mentions gui.py or the scripts/ tools.
- 9 Add a CITATION.cff and third-party attribution notes (Licensing chapter). Evidence: LICENSE is present but no citation/attribution file exists.
- 10 Add ethics, accessibility, and sustainability/maintenance notes (Ethical Research chapter). Evidence: presentation/Hackathon Presentation.pptx is an empty 0-byte placeholder with no ethics/accessibility statement elsewhere.

## Limitations

This review only inspected files present in the local checkout of the main branch at the commit noted above; it did not run the code, execute gui.py, train a model, or access any GitHub-hosted Issues/Discussions/Wiki content outside the Git repository itself. Scores reflect a hackathon-stage research prototype and are not a judgment of the underlying scientific or clinical validity of the range-shifter detection approach. No credentials, PHI, or restricted files were accessed or referenced in this review.

**This is a Turing Way-aligned readiness snapshot — not an official Turing Way certification.**
