

Turing Way-Aligned Readiness Snapshot

This is a Turing Way-aligned readiness snapshot produced with the assistance of public [The Turing Way](#) guidance. It is NOT an official Turing Way certification. The Turing Way project does not operate a certification authority, and no such authority was consulted. Scores reflect only what could be directly observed in the reviewed repository at the commit noted below.

- **Repository reviewed:** [stjude-biohackathon/KIDS25-Team5](#)
- **Commit reviewed:** `d614403d24f8d1842c7aae698932654a2aedba8`
- **Review date:** 2026-09-18
- **Scope:** Entire public repository as checked out (data dictionaries, SAS/CSV datasets, metadata guides, `README.md`, `LICENSE`, `WORKFLOW.md`). No private, restricted, or credential-bearing files were reviewed.
- **Confidence:** Medium. The repository is a data-and-documentation project (no application source code), so several rubric criteria written for software projects had limited applicable evidence to find; absence of evidence for a practice was scored as such, not assumed to be a hidden strength.

Ten-Criterion Score Table

Each criterion is scored 0–10 (0 = no reliable evidence found, 5 = partially or inconsistently documented, 10 = clear, repeatable, and maintained). The total is out of 100.

#	Criterion	Score (/10)	Key Observed Evidence
1	Project purpose and scope	3	<code>README.md</code> is a single line (<code># KIDS25-Team5</code>); scope, research question, and limitations are only inferable from <code>metadata/AI_navigation_guide.md</code> , not stated up front.
2	Version control and provenance	4	24 commits from 4 authors give some history, but ~1.5GB of <code>.sas7bdat</code> files and ~672MB of CSVs are committed directly to Git with no <code>.gitattributes</code> /Git LFS, and there are no tags or releases.
3	Open collaboration	3	5 open GitHub issues show active task tracking, but there is no <code>CONTRIBUTING.md</code> , <code>CODE_OF_CONDUCT.md</code> , or <code>.github/</code> community-health directory anywhere in the repository.
4	Reproducible environments	1	No <code>requirements.txt</code> , <code>environment.yml</code> , <code>Dockerfile</code> , notebooks, or analysis code exist; the repository holds only data and two Markdown documents.
5	Data and workflow provenance	6	<code>metadata/AI_navigation_guide.md</code> , <code>metadata/cohort_timeline_map.md</code> , <code>metadata/directory_structure_guide.md</code> , <code>metadata/questionnaire_cross_reference.md</code> , <code>dictionary/readme.txt</code> , and folder-level READMEs (e.g. <code>sasdata/obase23/README.md</code>) document structure and variables well, but no formal data management plan or explicit versioning/naming policy is stated.
6	Testing and validation	0	No test files, test directories, or documented validation/data-quality checks were found anywhere in the repository.
7	Automation and continuous integration	0	No <code>.github/workflows</code> directory or other CI configuration exists.
8	Documentation and usability	5	<code>WORKFLOW.md</code> documents a proposed application workflow with a Mermaid diagram, and the <code>metadata/ / dictionary/</code> guides are detailed, but the root <code>README.md</code> does not link to any of them, and there is no roadmap or changelog.
9	Licensing, attribution, and responsible reuse	4	An MIT <code>LICENSE</code> is present at the root, but there is no <code>CITATION.cff</code> or other citation/attribution guidance for reusing the dataset.
10	Ethics, accessibility, and sustainability	1	The repository holds pediatric cancer survivor cohort (CCSS) survey data; only a single named contact e-mail appears in <code>dictionary/readme.txt</code> / <code>metadata/readme.txt</code> , with no visible ethics/IRB/consent/data-sharing statement and no accessibility or archival/sustainability plan.
Total			

#	Criterion	Score (/10)	Key Observed Evidence
		27 / 100	

Recommendations (with Turing Way Citations)

1. **Expand** `README.md` to state the project's research question/purpose, intended users, scope, and known limitations, per The Turing Way's [Guide for Project Design](#). *Repository fact:* `README.md` is currently a single line.
2. **Adopt Git LFS (or an equivalent) for large binary datasets** to keep provenance traceable without bloating the main Git history, per The Turing Way's [Version Control](#) chapter. *Repository fact:* ~1.5GB of `.sas7bdat` files under `sasdata/` are committed directly with no LFS configuration.
3. **Add** `CONTRIBUTING.md` **and** `CODE_OF_CONDUCT.md` to formalize how outside contributors can engage, per The Turing Way's [Contributing](#) guidance. *Repository fact:* No `CONTRIBUTING.md`, `CODE_OF_CONDUCT.md`, or `.github/` directory exists; 5 open issues track work informally.
4. **Document or provide a reproducible computational environment** (e.g. a `requirements.txt` / `environment.yml` and analysis scripts/notebooks) so others can recreate any processing of this data, per The Turing Way's [Reproducibility Methods](#). *Repository fact:* the repository root has no dependency manifest, container definition, or code/notebooks.
5. **Write a Data Management Plan / naming and versioning policy** to complement the existing dictionaries and guides, per The Turing Way's [Research Data Management Checklist](#). *Repository fact:* `metadata/` and `dictionary/` document structure and variables well but no DMP exists.
6. **Add automated or documented validation checks** for the datasets (e.g. schema/row-count checks), per The Turing Way's [Code Testing](#) chapter. *Repository fact:* no test files or validation scripts exist in the repository.
7. **Introduce CI automation** (e.g. GitHub Actions) once code or checks exist, so that failures are visible to contributors, per The Turing Way's [Continuous Integration](#) chapter. *Repository fact:* no `.github/workflows` or other CI configuration exists.
8. **Link the root README to** `WORKFLOW.md` **and the** `metadata/` / `dictionary/` **guides**, and add a roadmap/ changelog, per The Turing Way's [Project Documentation](#) guidance. *Repository fact:* `WORKFLOW.md` and the metadata guides exist but are not referenced from `README.md`.
9. **Add a** `CITATION.cff` describing how to cite this dataset/repository, in addition to the existing MIT `LICENSE`, per The Turing Way's [Licensing](#) chapter. *Repository fact:* `LICENSE` (MIT) exists but no `CITATION.cff` does.
10. **Document ethics/consent/data-sharing status and an accessibility or sustainability/archival plan**, given this repository holds pediatric cancer survivor cohort survey data, per The Turing Way's [Accessibility](#) chapter. *Repository fact:* `dictionary/readme.txt` / `metadata/readme.txt` provide only a contact e-mail, with no ethics/IRB/consent statement or accessibility/sustainability plan found.

Limitations of This Review

- This snapshot is not an official Turing Way certification; The Turing Way publishes best-practice guidance, not a certifying body or standard.
- The review is based on static inspection of the repository at one commit and did not execute any code, since none exists in the repository.
- Sensitive material (credentials, PHI, restricted files) was excluded from consideration; the absence of an ethics/ consent statement is reported as an observed documentation gap, not a determination about the underlying data governance, which may exist outside this repository.
- Scores reflect only what is directly observable in this repository; any undocumented practices that exist elsewhere (e.g., institutional IRB approvals, private CI, or internal contribution processes) were not visible to this review and could not be credited.

Total Score: 27 / 100
