

Turing Way-Aligned Readiness Snapshot

This is not an official certification. The Turing Way is a collection of open, community-authored best-practice guidance for reproducible, collaborative, and ethical research software. There is no Turing Way certifying body and no institutional or legal certification program behind this document. This report is a transparent, evidence-based readiness snapshot produced by comparing observable repository facts against Turing Way guidance. It should not be represented as compliance certification, a security audit, or an institutional approval.

- **Repository reviewed:** `stjude-biohackathon/KIDS25-Team7`
- **Commit reviewed:**
`8ffe7bc71be4f49e97be206f9951bb02f417bdf65 (origin/main)`
- **Review date:** 2026-09-18
- **Scope:** Entire public repository as checked out at the commit above (root files, `frontend/` application code, mock data, and configuration). No private branches, secrets, or non-public material were accessed.
- **Confidence: Medium.** Repository facts (file presence/absence, contents, and git history) were directly observed and are high-confidence. Turing Way guidance was retrieved via the project's RAG evidence tools with moderate-to-high relevance scores (~60–90%); criterion scores are a qualitative judgment applying that guidance to the observed facts, not a formula.

Total Score

26 / 100

This is a low readiness score, consistent with a small hackathon-origin prototype (St. Jude BioHackathon, 2025) that has working application code but has not yet adopted most reproducibility, collaboration, testing, or governance practices described in The Turing Way.

Score Table

#	Criterion	Score (/10)	Repository Fact	Turing Way Guidance
1	Project purpose and scope	2	Root <code>README.md</code> contains only the single line <code># KIDS25-Team7</code> ; no purpose, research	Project Design

#	Criterion	Score (/10)	Repository Fact	Turing Way Guidance
			question, intended users, or limitations are documented anywhere in the repository.	
2	Version control and provenance	6	<code>git log</code> shows 59 commits across contributor branches (<code>adalecki</code> , <code>rschmitz2</code> , <code>esavage</code> , <code>frontend</code>) merged into <code>main</code> via numbered, reviewed pull requests (e.g. "Merge pull request #32"). No tags or releases exist, so there are no pinned, citable snapshots.	Version Control
3	Open collaboration	3	No <code>CONTRIBUTING.md</code> , <code>CODE_OF_CONDUCT.md</code> , <code>SECURITY.md</code> , or <code>.github</code> issue/PR templates exist. A PR-review merge pattern is visible in git history, but no documented contribution path, review expectations, or maintainer/governance information exists.	Collaboration
4	Reproducible environments	5	<code>frontend/package-lock.json</code> (302 KB) pins exact dependency versions, and <code>frontend/README.md</code> documents <code>git clone</code> → <code>npm install</code> → <code>npm run start</code> setup steps. However, the root <code>package.json</code> is an empty <code>{}</code> object with no scripts/dependencies, and there is no containerization (e.g. <code>Dockerfile</code>) or documented Node/npm version requirement.	Research Data Management Checklist
5	Data and workflow provenance	1	<code>frontend/public/db.json</code> (2071 bytes) and <code>routes.json</code> are committed as mock API data with no <code>README</code> , schema, or comments describing their fields, structure, or provenance. No workflow/pipeline documentation exists for how data flows through the app beyond code comments.	Research Data Management Checklist
6	Testing and validation	0	A recursive search for <code>*.test.*</code> and <code>*spec*</code> across the repository (excluding <code>node_modules</code>) returned zero matches. No test framework is configured in <code>frontend/package.json</code> , and no validation/fixture files exist.	Testing Guidance
7	Automation and continuous integration	0	No <code>.github</code> directory and no <code>*.yaml</code> / <code>*.yml</code> workflow files exist anywhere in the repository, so there is no CI running tests, linting, builds, or reproducibility checks on pushes or pull requests.	Continuous Integration
8	Documentation and usability	4	<code>frontend/README.md</code> (4581 bytes) documents application architecture, API flow, file organization, and a step-by-step development workflow with examples. The root <code>README.md</code> is a single 14-byte title line, there is no project-level <code>docs/</code> directory, and no end-user usage guide or documented limitations exist.	Project Documentation

#	Criterion	Score (/10)	Repository Fact	Turing Way Guidance
9	Licensing, attribution, and responsible reuse	5	An MIT LICENSE file exists at the repository root, copyrighted to "St. Jude Children's Research Hospital BioHackathon (2025)", giving clear, permissive reuse terms. No CITATION.cff or citation guidance exists, and no third-party attribution notes are documented for bundled dependencies (e.g. Ketcher, RDKit).	Licensing (FLOSS)
10	Ethics, accessibility, and sustainability	0	No file in the repository (README, LICENSE, or elsewhere) mentions data ethics/privacy handling, accessibility (e.g. WCAG) considerations, or a maintenance/archival plan for the project after the hackathon.	Licensing and Ethical Source
	Total	26 / 100		

Checks Performed

- Read README.md, LICENSE, package.json at the repository root.
- Read frontend/README.md, frontend/package.json, frontend/package-lock.json, frontend/eslint.config.js, frontend/.gitignore.
- Listed frontend/src recursively (components, pages, api, types, utils, css).
- Searched the whole repository for .github/ workflows, *.yaml / *.yml, CONTRIBUTING*, CODE_OF_CONDUCT*, SECURITY*, CITATION*, *.test.*, and *spec* files — all returned zero matches.
- Inspected frontend/public/ (mock db.json, routes.json, logo assets).
- Reviewed git log --oneline --all (59 commits), git branch -a (4 remote contributor branches plus main), git tag (none), and git shortlog -sn --all (6 contributors).
- Retrieved Turing Way guidance via the required RAG evidence tools (get_rag_status, get_turing_way_review_evidence, list_resources, query_mygpt_context, get_turing_way_evidence_packets) before scoring.

Recommendations

1. **Write a real root README** covering the project's purpose (a chemical compound registration/search tool built at the St. Jude BioHackathon), intended users, current scope, and known limitations. (*Criterion 1 — [Project Design](#)*)
2. **Tag a release** (e.g. v0.1.0-hackathon) to create a citable, pinned snapshot of the working prototype. (*Criterion 2 — [Version Control](#)*)

3. **Add** `CONTRIBUTING.md` **and** `CODE_OF_CONDUCT.md` describing how to propose changes, review expectations, and community conduct standards. (Criterion 3 — [Collaboration](#))
4. **Populate the root** `package.json` **or add a top-level setup script**, and consider a `Dockerfile` or `.nvmrc` / `engines` field to capture the exact runtime environment. (Criterion 4 — [RDM Checklist](#))
5. **Document** `db.json` / `routes.json` with a short schema description and note that they are mock/development data, not production data. (Criterion 5 — *same RDM Checklist reference*)
6. **Add automated tests** (e.g. Vitest/React Testing Library for the frontend) covering at least the API service layer and key components. (Criterion 6 — [Testing Guidance](#))
7. **Add a GitHub Actions workflow** to run `npm run lint`, `npm run build`, and (once added) tests on every pull request. (Criterion 7 — [Continuous Integration](#))
8. **Expand documentation** beyond `frontend/README.md` with a top-level `docs/` overview linking to the frontend guide and describing overall project usage. (Criterion 8 — [Project Documentation](#))
9. **Add a** `CITATION.cff` so the software can be properly cited, and note licenses/attribution for bundled third-party components (Ketcher, RDKit). (Criterion 9 — [Licensing \(FLOSS\)](#))
10. **State a data-handling/ethics note and a maintenance plan** — even a short statement on whether the app processes real research/patient data and who (if anyone) will maintain it after the hackathon. (Criterion 10 — [Licensing and Ethical Source](#))

Limitations

- This snapshot reflects only the single commit reviewed (`8ffe7bc71be4f49e97be206f9951bb02f417bdf65`) and may not reflect subsequent changes.
- Only publicly observable repository content was reviewed; no CI logs, private discussions, issue trackers, or external documentation sites were inspected.
- Scores are qualitative judgments informed by Turing Way guidance, not a deterministic formula; a different reviewer applying the same rubric to the same evidence could reasonably assign adjacent scores (e.g. ± 1 –2 points per criterion).
- This report is **not** an official Turing Way certification, security review, or institutional compliance approval. It is a best-practice readiness snapshot intended to help the team prioritize improvements.
