

Turing Way-aligned Readiness Snapshot

Not an official certification. Transparent readiness snapshot informed by The Turing Way public guidance.

Review date: 2026-09-18 **Repository commit:** 5362e9fa10adec4ed642959e178688000dccce88

Scale: 0 = no reliable observable evidence; 5 = partial/inconsistent documentation; 10 = clear, repeatable, maintained practice.

#	Criterion	Score (0-10)	Observable repository evidence	Reason for score
1	Project purpose and scope	6	README explains the LLM CLI-help parser, WDL outputs, core functions, and planned Nextflow.	Purpose/scope clear; intended users, success measures, maintenance scope, and limitations are not explicit.
2	Version control and provenance	5	Meaningful feature/fix history; four authors in inspected history.	Git provenance present; no tags, releases, changelog, or release process.
3	Open collaboration	2	README invites issues and pull requests.	No contribution guide, conduct, maintainers, review expectations, governance, or discussion path.
4	Reproducible environments	5	pyproject.toml declares Python >=3.10 and dependencies; README documents Ollama.	No locked dependencies, environment file, container, or platform matrix.
5	Data and workflow provenance	6	README describes command-help input, JSON/WDL output, examples; schemas/tests tracked.	Data sources, generated-artifact retention, metadata, and execution examples are incomplete.
6	Testing and validation	6	Ten Python test modules and one representative fixture are tracked.	No public test command in README; end-to-end test is placeholder; no coverage threshold.
7	Automation and continuous integration	0	No tracked CI configuration found.	No visible test, packaging, quality, or reproducibility automation.
8	Documentation and usability	7	README provides prerequisites, installation, quick start, options, outputs, troubleshooting.	No versioned support policy, developer workflow, or consolidated limitations.
9	Licensing, attribution, and responsible reuse	6	MIT LICENSE tracked; README has a plain-text citation.	No CITATION.cff, DOI/archive, release citation, or third-party attribution inventory.
10	Ethics, accessibility, and sustainability	1	README offers local Ollama, reducing some cloud reliance.	No ethics/privacy, accessibility, resource-use, archival, or maintenance plan.
TOTAL		44 / 100	Early-stage readiness: documentation, testing, licensing exist.	Automation, collaboration, release, and sustainability practices need attention.

Priority recommendations: Add CI and meaningful end-to-end validation; publish a roadmap and changelog; add CONTRIBUTING.md, CODE_OF_CONDUCT.md, maintainers, and review expectations; add CITATION.cff and archive a tagged release; capture a repeatable environment.

Pinned Turing Way guidance: Project Design; Project Documentation; Collaboration; Research Infrastructure Developer (all at the-turing-way/the-turing-way commit bb3f7abb56a40cd92a654fb51e4ec91f429cca2a).

Confidence: moderate (7/10). Public tracked files/history were reviewed. GitHub settings, external archives, registries, and untracked policies were outside scope.
