

Turing Way-Aligned Readiness Snapshot

This is not an official certification. The Turing Way is public best-practice guidance for reproducible, collaborative, and open research projects — it is not a certification authority, and no institution has authorized this document as a formal compliance certificate. This report is a transparent, evidence-based readiness snapshot only.

Repository: stjude-biohackathon/KIDS25-Team12

Reviewed commit: 8dafc2816e4f7aee61a5fcc486a2d34e63932f77 (main)

Review date: 2026-09-18

Scope: Full public repository as checked out (application source under src/, public/, Image Projects/, build/config files, README.md, LICENSE, and git history). No private or sensitive data was reviewed.

Confidence: Medium. Findings are based on direct inspection of files, git log, and package.json in the working tree; no network access to the live GitHub UI (issues/discussions/branch protection) was used, so collaboration surfaces hosted only on GitHub.com could not be verified beyond what is committed to the repository.

Ten-criterion rubric (0–10 each, total out of 100)

#	Criterion	Score	Key evidence
1	Project purpose and scope	1/10	README.md contains only "How to run" instructions and generic Vue 3 + TypeScript + Vite template boilerplate; no stated research question, purpose, intended users, or known limitations.
2	Version control and provenance	6/10	git log shows 47 commits from 4 named contributors with descriptive feat/fix: messages and merge commits, giving a traceable history; however, no Git tags or releases exist to pin provenance of shipped versions.
3	Open collaboration	2/10	No CONTRIBUTING.md, CODE_OF_CONDUCT.md, or .github/ISSUE_TEMPLATE files exist despite 4 active contributors, so contribution norms and review expectations are undocumented.
4	Reproducible environments	5/10	README.md documents npm run dev and pins exact node, npm, vuetify, and vite versions used; package-lock.json pins transitive dependencies. No containerization or OS/environment capture beyond Node tooling.
5	Data and workflow provenance	1/10	public/ and Image Projects/ contain many generated images and audio assets (e.g. "Generated Image September 30, 2025 - 2_26PM.png") with no documentation of their source, generation workflow, or licensing/attribution.
6	Testing and validation	1/10	package.json declares a test script (vitest) and lists vitest/@vue/test-utils as devDependencies, but no *.spec.ts or *.test.ts files exist anywhere in the repository — the tooling is unused.
7	Automation and continuous integration	0/10	No .github/workflows directory or any other CI/automation configuration exists in the repository.
8	Documentation and usability	3/10	README covers only run steps and unedited Vue/Vite template text; no user-facing feature documentation, onboarding path, or documented limitations for this specific application.
9	Licensing, attribution, and responsible reuse	4/10	An MIT LICENSE file (St. Jude Children's Research Hospital BioHackathon, 2025) is present and clear, but there is no CITATION.cff and no attribution documented for third-party or generated media assets.
10	Ethics, accessibility, and sustainability	1/10	Only one component (src/views/Home.vue) shows any alt/aria- usage; no accessibility statement, no ethics/privacy note despite health-themed comic content, and no maintenance/archival plan.
Total		24/100	

Observations (evidence, separate from recommendations)

- The project is a Vue 3 + TypeScript + Vite + Vuetify single-page application ("typescript-bbq-boilerplate") that presents interactive comics/audio content, built during the St. Jude KIDS25 BioHackathon.
- git log (8dafc28): 47 commits, contributors Jared Andrews, Michael Gattas, PepeRulo, ryanne-m; no tags exist.
- package.json: scripts are dev, build, preview, test; dependencies include vue, vuetify, pinia, vue-router, axios, webfontloader; devDependencies include vitest, @vue/test-utils, eslint, typescript.
- No files found matching *.spec.ts / *.test.ts anywhere in the tree.
- No .github/ directory exists at all (no workflows, issue templates, or PR templates).
- LICENSE is the MIT License, copyright St. Jude Children's Research Hospital BioHackathon (2025).
- README.md is limited to run instructions and unedited Vite/Vue scaffold documentation; it does not describe the project's purpose.

Recommendations (cited to Turing Way guidance)

- Add tests that exercise the declared vitest/@vue/test-utils tooling. *Turing Way: Testing Guidance* ([the-turing-way/the-turing-way, book/website/reproducible-research/testing/testing-guidance.md](#))
- Add a CI workflow (e.g. GitHub Actions) to run linting, type-checking, and tests automatically. *Turing Way: CI Practices* ([book/website/reproducible-research/ci/ci-practices.md](#))
- Add CONTRIBUTING.md, CODE_OF_CONDUCT.md, and issue/PR templates. *Turing Way: Version Control* ([book/website/reproducible-research/vcs.md](#))
- Rewrite README.md's project section to state purpose, audience, and limitations. *Turing Way: Guide for Project Design* ([book/website/project-design/project-design.md](#))
- Add a CITATION.cff and document provenance/attribution for bundled media assets. *Turing Way: Open Source* ([book/website/reproducible-research/open/open-source.md](#))

Limitations of this review

- This review is a static, point-in-time snapshot of the committed files and local git log; it does not reflect GitHub-hosted collaboration surfaces beyond what is committed to the repository.
- Scores reflect only directly observable repository evidence; no criterion was skipped or merged with another.
- This snapshot must not be represented as an official Turing Way certification, endorsement, or institutional approval.

Total score: 24 / 100
