

Turing Way-Aligned Readiness Snapshot

This is a Turing Way-aligned readiness review produced with automated assistance. It is not an official Turing Way certification, and The Turing Way is not a certification authority. No institution or governing body has authorized this report as a compliance or certification decision. Treat it as a transparent, evidence-based snapshot of observable practices, not a guarantee of quality or an endorsement.

- **Repository:** [stjude-biohackathon/KIDS25-Team13](#)
- **Reviewed commit:** cb4d02b72f33d67c8f12ba9a78963574fc524e1f (branch main)
- **Review date:** 2026-09-18
- **Scope:** Publicly accessible repository contents (root files, commit history, issues/pull requests, releases, and GitHub Actions configuration) as of the reviewed commit. No private or non-public information was inspected.
- **Confidence:** High — the repository is extremely small (two files, one commit), so observable evidence is unambiguous and easy to verify directly against the GitHub API and checkout.

Method

Evidence was gathered directly from the repository (file listing, `git log`, `gh api` calls for issues, pull requests, releases, branches, and Actions workflows) and cross-referenced against pinned guidance retrieved from *The Turing Way* via the required learning-assistant evidence tools (`get_turing_way_review_evidence` and `get_turing_way_evidence_packets`, backed by `list_resources/get_resource`). Each row below cites one directly observed repository fact and one pinned Turing Way chapter. Scores use the ten-criterion, 0–10 rubric (10 criteria × 10 points = 100 total); 0 means no reliable evidence was found, 5 means the practice is partially or inconsistently documented, and 10 means the practice is clear, repeatable, and maintained.

Score table

#	Criterion	Score (/10)	Observed repository evidence	Turing Way guidance
1	Project purpose and scope	0	README.md is a single 15-byte line, # KIDS25-Team13, with no research question, scope, intended users, or known limitations.	Guide for Project Design
2	Version control and provenance	1	The main branch has a single "Initial commit," no tags or releases exist, and PR #1 ("Added CLAUDE.md") is open and unmerged.	Version Control
3	Open collaboration	1	Issues/PRs are enabled and one PR is in progress, but the repository tree has no CONTRIBUTING.md, CODE_OF_CONDUCT.md, issue templates, or PR templates.	Maintaining and Reviewing Contributions
4	Reproducible environments	0	The repository root contains only LICENSE and README.md; no dependency manifest, environment file, or setup instructions exist.	Overcoming Barriers to Reproducible Research
5	Data and workflow provenance	0	No data directory, workflow files, or scripts exist anywhere in the repository tree .	Metadata for Data Management

#	Criterion	Score (/10)	Observed repository evidence	Turing Way guidance
6	Testing and validation	0	No test files, test directories, or documented validation instructions exist in the repository tree .	Testing Guidance
7	Automation and continuous integration	0	The GitHub Actions workflows API returns an empty list; there is no <code>.github/workflows</code> directory or CI configuration.	Continuous Integration Practices
8	Documentation and usability	0	README.md contains only a title heading, with no usage, installation, or onboarding content.	Code Documentation for Projects
9	Licensing, attribution, and responsible reuse	6	An MIT LICENSE file is present and unambiguous, but no <code>CITATION.cff</code> or other citation/attribution guidance exists.	Licensing FLOSS Projects
10	Ethics, accessibility, and sustainability	0	No ethics statement, accessibility notes, or sustainability/maintenance plan appear anywhere in the repository .	Governance in Open Source Projects

Total: 8 / 100

Recommendations

1. Write a real README covering the project's research question, scope, intended users, and known limitations (cites *Project Design*).
2. Merge or close the pending pull request and adopt an incremental commit and tagging/release practice going forward (cites *Version Control*).
3. Add `CONTRIBUTING.md`, `CODE_OF_CONDUCT.md`, and issue/PR templates to set expectations for contributors (cites *Maintaining and Reviewing Contributions*).
4. Add setup instructions and a pinned dependency/environment manifest (e.g., `requirements.txt`, `environment.yml`, or a container definition) (cites *Overcoming Barriers to Reproducible Research*).
5. Document any data sources, schemas, and workflow steps once code or data are added (cites *Metadata for Data Management*).
6. Add automated or documented tests with clear instructions for reproducing checks (cites *Testing Guidance*).
7. Add a CI workflow (e.g., GitHub Actions) so checks run automatically and failures are visible to contributors (cites *Continuous Integration Practices*).
8. Expand documentation with usage examples and an onboarding path as the project grows (cites *Code Documentation for Projects*).
9. Add a `CITATION.cff` file to complement the existing MIT license and clarify reuse/citation expectations (cites *Licensing FLOSS Projects*).
10. Add a short statement on ethical considerations, accessibility, and a sustainability/maintenance plan (cites *Governance in Open Source Projects*).

Limitations

- The repository consists of only two files (`LICENSE`, `README.md`) and one commit at the time of review; most criteria could not be evaluated beyond their absence.
- Private repository data, non-public discussions, and any external infrastructure (e.g., private CI, private data stores) were not accessible and were not assumed to exist.
- This snapshot reflects the reviewed commit only and will not update automatically as the repository changes.

- This is not an official Turing Way certification; it is guidance-aligned and produced with automated assistance, for the team's own use in improving research-software practice.
