

Turing Way-Aligned Readiness Snapshot

This is not an official certification. The Turing Way is public best-practice guidance, not a certification authority or institutional policy. This document is a transparent, evidence-based readiness snapshot against a ten-criterion rubric inspired by *The Turing Way*, produced for internal reference only.

- Review date: 2026-09-18
- Repository reviewed: stjude-biohackathon/KIDS25-Team19 (<https://github.com/stjude-biohackathon/KIDS25-Team19>)
- Commit reviewed: a836a1fd76c528fa7cf4785ef67817ee2a612647 (branch main)
- Scope: Entire public repository as committed at the reviewed commit — README.md, LICENSE, global.R, server.R, ui.R. No other files, directories, or hidden configuration were present.
- Confidence: Moderate-to-high. The repository is small (5 files, 2 commits) and every observation was made directly against files present at the reviewed commit; absence claims (no tests, no CI, no CONTRIBUTING, etc.) are high confidence, while the version-control and licensing scores carry moderate confidence.
- **Total score: 11 / 100**

Ten-criterion rubric (0–10 each, 100 total)

#	Criterion	Score	Evidence (repository fact)	Turing Way guidance cited
1	Project purpose and scope	0/10	README.md exists but contains 0 lines of content; no other document states the project's purpose, scope, intended users, or limitations.	Project Design
2	Version control and provenance	2/10	git log shows only two commits ('Initial commit', 'Initial code commit') and git tag returns no tags as of a836a1f; history exists but carries no descriptive messages, tags, or releases.	Version Control
3	Open collaboration	0/10	A repository-wide search of the tree at a836a1f finds no CONTRIBUTING.md, CODE_OF_CONDUCT.md, or .github/ issue templates in the repository root.	New Community Tech Issues
4	Reproducible environments	1/10	global.R lists 19 library() calls with no version pins, and the repository has no renv.lock, Dockerfile, or environment.yml.	Renv Package
5	Data and workflow provenance	1/10	server.R queries an authControl.db SQLite database and calls internal endpoints (e.g. apis-research.stjude.org/srmapi) with no schema, sample data, or provenance documentation checked into the repo.	RDM Checklist
6	Testing and validation	0/10	The repository tree at a836a1f contains only global.R, server.R, ui.R, README.md, and LICENSE; there is no tests/ directory, testthat file, or documented test procedure.	Testing Guidance
7	Automation and continuous integration	0/10	No .github/workflows directory or any other CI configuration file exists in the repository tree at a836a1f.	Continuous Integration
8	Documentation and usability	1/10	README.md has 0 lines of content, and no other documentation file (docs/, wiki, or usage guide) exists; a small amount of in-app help text exists inside server.R's output\$tokens.	Code Documentation
9	Licensing, attribution, and responsible reuse	6/10	LICENSE contains the full MIT License text with copyright "(c) 2025 St. Jude Children's Research Hospital BioHackathon"; there is no CITATION.cff or third-party attribution notice for the bundled R packages.	Licensing (FLOSS)
10	Ethics, accessibility, and sustainability	0/10	server.R processes user, PI, and department personal data retrieved from internal St. Jude APIs and sends email, with no privacy, accessibility, or maintenance/archival statement in any repository file.	Ethics and Open Source Governance
	Total	11/100		

Total: 11 / 100

Checks performed

- Listed the full repository tree at the reviewed commit (README.md, LICENSE, global.R, server.R, ui.R; no hidden directories).

- Read README.md (0 lines), LICENSE (MIT, full text), global.R (dependency list), server.R (250 lines), and ui.R (61 lines) in full.
- Inspected git log --oneline, git branch -a, and git tag for version-control history.
- Searched for CONTRIBUTING.md, CODE_OF_CONDUCT.md, .github/ templates, .github/workflows/, tests/, renv.lock, Dockerfile, and environment.yml — none were present.
- Retrieved matching Turing Way guidance for each criterion via the required learning-assistant evidence tools before scoring.

Recommendations

- 1 Project purpose and scope: Add a README describing the app's purpose (SRM email templating for St. Jude Shared Resources), intended users, and known limitations, per Turing Way project design guidance.
- 2 Version control and provenance: Adopt descriptive commit messages and tag releases as the app stabilizes.
- 3 Open collaboration: Add CONTRIBUTING.md, a code of conduct, and clarify maintainership/issue-reporting paths.
- 4 Reproducible environments: Pin package versions (e.g. via renv::snapshot()) and commit a lockfile or container definition.
- 5 Data and workflow provenance: Document the authControl.db schema, the external SRM/CAGE API contracts, and the email-template token system referenced in server.R.
- 6 Testing and validation: Add automated tests (e.g. testthat) for the reactive logic in server.R, especially department-conditional branches.
- 7 Automation and CI: Add a CI workflow (e.g. GitHub Actions) to lint/check the R code on each change.
- 8 Documentation and usability: Expand the README into setup/usage instructions; the in-app token help text in server.R is a good start but is not discoverable outside the running app.
- 9 Licensing, attribution, and responsible reuse: Add a CITATION.cff and attribution notes for the third-party R packages the app depends on.
- 10 Ethics, accessibility, and sustainability: Document handling of personal/institutional data (user, PI, department, email), and note a maintenance/archival plan.

Limitations

- This snapshot reflects only the single commit reviewed (a836a1f) on the main branch; it does not reflect any later changes.
- Only repository-observable evidence was used; no runtime testing of the Shiny app, no access to authControl.db contents, and no verification of the internal St. Jude APIs it calls were performed or attempted.
- Confidence in the exact numeric score for "Version control and provenance" and "Licensing, attribution" is moderate — these are judgment calls within the rubric's 0–10 band rather than binary presence/absence checks.
- This is a readiness snapshot against The Turing Way's published best-practice guidance, not an official Turing Way certification, and carries no legal, institutional, or security-audit weight.
