

Turing Way-aligned readiness snapshot

Not an official certification.

This is a transparent, evidence-based

readiness snapshot aligned with _The Turing Way_;

it is not a certification

by, or on behalf of, _The Turing Way_.

Repository reviewed: stjude-biohackathon/KIDS25-Team8_OnDemand_Nextflow

Review scope: Entire public repository at the commit below; only tracked, non-sensitive repository material was assessed.

Repository revision: 272209bf4cc73b4273cea21f52ba3dadada699c7

Review date: 2026-09-18

Confidence: Moderate (7/10)

Total score: 28 / 100

Each criterion is scored once from 0 to 10 using observable evidence only:
0 = no reliable evidence; 5 = partial or inconsistently documented practice;
10 = clear, repeatable, maintained practice.

#	Criterion	Score (0-10)	Observable repository evidence	Assessment
1	Project purpose and scope	4	README identifies an OnDemand interface for Nextflow and its LSF/HPC constraint.	Basic purpose and a known limitation are clear. Intended users, support boundary, deployment prerequisites, objectives, and success criteria are not documented.
2	Version control and provenance	7	The public Git history records changes; CHANGELOG.md records version 0.99.0.	Public Git history and a changelog establish useful source provenance. No tagged release, release artifact, or documented provenance process is observable.
3	Open collaboration	1	The project is publicly hosted on GitHub. The pinned tree contains no contribution guide, code of conduct, issue templates, review policy, or maintainership information.	A public repository enables discovery, but contributors have no documented participation path or community norms.
4	Reproducible environments	4	The job template loads Nextflow/24.10.2, specifies a Singularity cache, accepts a pipeline revision and parameters file, and supports resume.	Several runtime controls are explicit. There are no setup instructions, dependency manifest, captured environment, supported platform matrix, or reproducible environment validation.
5	Data and workflow provenance	3	manifest.yml describes parameter-file input and resume behavior; the template records the execution workflow.	Input format and core execution steps are partially documented. Input/output schemas, sample data, generated artifacts, data sources, retention, and metadata practices are not published.
6	Testing and validation	0	No test files or test configuration are present in the pinned tree.	No automated or documented validation procedure, fixtures, or acceptance criteria are observable.
7	Automation and continuous integration	0	No .github/workflows directory or other tracked CI configuration is present in the pinned tree.	No contributor-visible automation checks are observable.
8	Documentation and usability	3	The README and manifest describe the application at a high level.	The user-facing purpose is understandable, but deployment, configuration, end-to-end use, troubleshooting, examples, and maintenance documentation are absent.
9	Licensing, attribution, and responsible reuse	5	An MIT License is present. No CITATION.cff, preferred citation, or third-party attribution inventory is present in the pinned tree.	Reuse permissions are clear, but software attribution and citation guidance are incomplete.

10	Ethics, accessibility, and sustainability	1	The README notes the LSF/HPC limitation. No accessibility statement, ethics/privacy guidance, sustainability plan, archival plan, or maintenance policy is present in the pinned tree.	A material platform limitation is disclosed; no wider responsible-use, access, or long-term stewardship practice is documented.
----	---	---	--	---

Checks performed

Check	Result
Public tracked-file review	Complete: 10 tracked files, including documentation, templates, manifest, changelog, and license
Required learning-assistant review evidence	Retrieved before scoring
Pinned Turing Way guidance	Retrieved from immutable bb3f7abb56a40cd92a654fb51e4ec91f429cca2a references
Score coverage	Complete: exactly 10 criteria, each scored once on a 0-10 scale
PDF score-table verification	Complete: the generated PDF is non-empty and text extraction contains all 10 criteria and 28 / 100

Recommendations

1. Add a deployment and user guide covering Open OnDemand/LSF prerequisites, supported versions, configuration, a minimal parameters example, expected outputs, and troubleshooting.

1. Add template/configuration checks and a representative submission smoke test; execute them in pull-request CI.

1. Publish CONTRIBUTING.md, CODE_OF_CONDUCT.md, maintainership/support details, and issue templates.

1. Add CITATION.cff and an attribution inventory for bundled or external components.

1. Document accessibility, privacy/ethical boundaries, data handling, and a maintenance or archival plan.

Turing Way evidence and limitations

The learning assistant retrieved the following immutable Turing Way guidance before scoring and evidence packets were resolved against the pinned repository revision:

Turing Way guidance	Relevance to this snapshot
Project Design	Purpose, scope, users, constraints, and project planning
Project Documentation	README, contribution guidance, changelog, license, conduct, and citation
Version Control	Traceable, auditable provenance and collaboration
Reproducibility Methods	Environment, dependency, infrastructure, and data-management decisions

Limitations: This review scores only public, repository-observable evidence. It does not infer undocumented operational controls, private infrastructure, untracked documentation, or external support practices. The score is a readiness signal, not an official Turing Way certification.
