

Turing Way-aligned readiness snapshot

Not an official certification. This is a transparent, repository-only readiness snapshot informed by The Turing Way public best-practice guidance. The Turing Way is not represented as a certification authority.

Review details

Item	Value
Review date	2026-09-18
Scope	Public, tracked contents of <code>stjude-biohackathon/KIDS25-Team8_flowjomojo</code> at commit <code>1d005ca3f45cf0fca0a2e791b54e4913c9f3beb7</code>
Method	Observable repository evidence plus pinned Turing Way guidance; no hidden, sensitive, or external project materials reviewed
Confidence	Moderate (7/10): repository content was accessible and inspected, but deployment, GitHub settings, and untracked team practices were out of scope
Total	37 / 100

Score table

Scores are integers from 0 to 10. A score of 0 means no reliable repository evidence was found; 5 denotes partial or inconsistent evidence; 10 denotes clear, repeatable, maintained evidence.

#	Criterion	Score / 10	Observable repository evidence	Readiness reason
1	Project purpose and scope	7	<code>README.md</code> describes a browser-based ReactFlow app for generating Nextflow/WDL pipelines and gives a visual Quick Start.	Purpose and core audience are clear, but known limitations are not stated.
2	Version control and provenance	5	The Git history contains descriptive implementation commits. No tags or release metadata were found.	Change history is meaningful, but release and version provenance are not documented.
3	Open collaboration	1	No <code>CONTRIBUTING.md</code> , <code>CODE_OF_CONDUCT.md</code> , governance guide, issue/discussion path, review expectations, or maintainer information was found.	Public collaboration expectations and routes are largely absent.
4	Reproducible environments	5	<code>package.json</code> and <code>package-lock.json</code> declare the JavaScript dependencies and provide <code>build/lint</code> scripts.	Dependency capture is present, but no installation, supported-version, or environment setup guidance is documented.
5	Data and workflow provenance	4	<code>README.md</code> identifies the commands JSON location and shows an informal schema.	The bundled <code>commands.json</code> lacks source version, license, refresh process, and generated-artifact provenance.
6	Testing and validation	2	<code>package.json</code> offers lint and build commands; no test script or tracked test files were found.	Basic static/build checks exist, but automated behavioral validation and reproduction instructions are absent.
7	Automation and continuous integration	0	No GitHub Actions workflow or other tracked CI configuration was found.	No visible automation runs quality or reproducibility checks for contributors.

#	Criterion	Score / 10	Observable repository evidence	Readiness reason
8	Documentation and usability	7	README.md provides features, a four-step visual walkthrough, and commands JSON documentation.	Strong user-facing overview, but local installation and developer onboarding instructions are missing.
9	Licensing, attribution, and responsible reuse	6	The root LICENSE is MIT. No CITATION.cff, preferred citation, or third-party attribution inventory was found.	Reuse terms are clear, but scholarly attribution and dependency/data attribution are incomplete.
10	Ethics, accessibility, and sustainability	0	No ethics, privacy, accessibility, sustainability, archival, or maintenance-plan documentation was found.	No reliable evidence supports these project practices in the reviewed contents.

Evidence and pinned Turing Way guidance

The following recommendations are separate from the observed facts above. Each is grounded in an evidence packet retrieved from the Turing Way source pinned at commit `bb3f7abb56a40cd92a654fb51e4ec91f429cca2a`.

Readiness recommendation	Direct repository observation	Pinned Turing Way guidance
State intended users, scope boundaries, and known limitations in the README.	The purpose and workflow features are documented, but limitations are absent.	Accessible and equitable communication
Create tagged releases and describe version/release provenance.	Meaningful commits exist, but tags and release metadata were not found.	Maintaining and reviewing projects
Add contribution, conduct, governance, maintainer, and support-path documentation.	No such project files or README sections were found.	Guidance for new communities
Document local setup, supported Node.js versions, and dependency update practice.	Dependencies are declared and locked, but setup and version guidance are absent.	Project maintenance
Record <code>commands.json</code> source, version, license, schema, and refresh process.	The file is shipped with an informal README schema but no provenance metadata.	Data usage statement
Add representative automated tests and document how to run them.	Lint and build scripts exist, but no tests or test command were found.	Code review practices
Add visible CI for lint, build, and the new test suite.	No CI configuration was found.	Project maintenance
Add installation and developer-onboarding documentation.	The README offers user workflow guidance but no local setup path.	Accessible and equitable communication
Add a <code>CITATION.cff</code> and third-party/data attribution inventory.	MIT licensing is present; citation and attribution materials are absent.	License
Document relevant accessibility, privacy/ethics, maintenance, and archival commitments.	No documentation of these areas was found.	Equitable communication

Checks and limitations

The review inspected the tracked source tree, README, license, package metadata and lockfile, utility code, Git history, and the absence of test, CI, contribution, conduct, governance, citation, and data-management files. It does not assess GitHub-hosted settings, deployment configuration, untracked materials, organizational policies, or practices that are not observable in this public repository.

The score is a readiness signal, not a certification decision or an assertion of Turing Way compliance.
